

HelperDesk V1

Frontend Catch-Up Work — Days 7–10

Prepared from the current project roadmap and the frontend implementation plan discussed during development.

Overall Frontend Status

The backend for the core ticketing workflow is ahead of the frontend. The current frontend work is focused on bringing Days 7–10 of the HelpDesk roadmap together into a complete, consistent React experience.

Current target: complete Ticket CRUD, Agent queue and assignment views, ticket conversations, status lifecycle controls, and a shared notification/state system before beginning the full frontend integration test.

CURRENT CLASSIFICATION: FRONTEND CATCH-UP IN PROGRESS

Day 7 — Ticket CRUD Frontend

Goal: bring the customer ticket workflow fully into the React UI.

- Create Ticket form with title, description, and priority.
- Ticket List showing status, priority, requester, assignee, and dates.
- Ticket Details page with complete ticket information.
- Edit Ticket UI for permitted roles.
- Delete Ticket UI for Admin users with confirmation.
- Loading, empty, and error states.
- Immediate UI refresh after create, update, and delete operations.

Day 8 — Agent Dashboard and Assignment

Goal: give Agents a useful queue while allowing Admins to assign tickets dynamically.

- All Queue view for organization tickets.
- My Tickets view for tickets assigned to the logged-in Agent.
- Unassigned view for tickets awaiting assignment.
- Filtering and sorting controls.
- Agent self-assignment through Assign to Me.
- Admin assignment dropdown using real organization Agent data.
- Role-aware Team navigation.
- Clear display of ticket assignee and current status.

Backend Support Added for Frontend Assignment

Area	Status	Work
GET /tickets/agents/list	PLANNED	Returns support Agents belonging to the logged-in user's organization.
Authorization	REQUIRED	Endpoint restricted to Admin users.
Agent selection	REQUIRED	Select users with Agent role within the current organization.
Frontend usage	REQUIRED	Admin assignment UI uses real Agent data instead of hardcoded users.

Day 9 — Ticket Conversation

Goal: turn Ticket Details into the actual User ↔ Agent conversation interface.

- Fetch comments for the current ticket.
- Display messages chronologically.
- Show commenter name, role, timestamp, and message.
- Message composer and Send action.
- Clear composer after successful send.
- Optimistic UI where appropriate.
- Automatic scroll to the latest message.
- Empty conversation state.
- Hide or disable the composer when the user is not allowed to comment.
- Explain why an Agent cannot reply when the ticket is not assigned to them.

Day 10 — Status Lifecycle and Notifications

Goal: make the frontend follow the backend's valid ticket lifecycle instead of allowing arbitrary status changes.

Valid lifecycle

Area	Status	Work
Open → Assigned	VALID	Ticket becomes assigned.
Assigned → In Progress	VALID	Assigned Agent begins work.
In Progress → Resolved	VALID	Agent resolves the ticket.
Resolved → Closed	VALID	Admin closes the resolved ticket.
Resolved → Reopened	VALID	Admin reopens the resolved ticket.
Reopened → In Progress	VALID	Work resumes on the reopened ticket.
Closed → Reopened	NOT CURRENTLY ALLOWED	Do not expose this unless backend rules are changed.

- Only show controls appropriate to the user's role.
- Agents can transition tickets they are assigned to.
- Admins can perform Admin-only close/reopen actions.
- Prevent illegal transitions in the UI while keeping backend authorization as the final security layer.
- Show success, error, and information toasts after actions.
- Keep displayed status synchronized with the backend response.

Shared Frontend State and UI System

A shared notification layer is being introduced so individual pages do not implement separate notification logic.

Area	Status	Work
ToastContext	NEW	Global showToast(message, type) state and API.
Toast component	NEW	Premium glass-style floating notification with animated appearance/disappearance.
AppRoutes	MODIFY	Wrap the application with ToastProvider.
ticketService	MODIFY	Centralize ticket, comment, and Agent-list API calls.
BottomNav	MODIFY	Render navigation based on the logged-in user's role.

Role-Based Frontend Behavior

Area	Status	Work
End User	Role 3	Own tickets, no Team access, and comments only on tickets created by the user.
Agent	Role 2	Queue, My Tickets, Unassigned tickets, self-assignment, comments on assigned tickets, and permitted status changes.
Admin	Role 1	Organization-wide tickets, Agent assignment, permitted editing/deletion, comments, and Admin-only status actions.

Frontend Service Layer

The service layer provides a single place for the UI to communicate with the backend.

- fetchComments(ticketId)
- createComment(ticketId, commentText)
- fetchAgents()
- Existing ticket CRUD methods remain the source for ticket operations.
- All requests use the authenticated session/token; backend authorization remains the final permission check.

Frontend Verification Plan

The frontend should not be considered caught up until the UI is tested against the real backend.

- Start Vite frontend and Node backend together.
- Verify Ticket CRUD in the browser.
- Verify Agent queue, My Tickets, and Unassigned Tickets.
- Verify Agent self-assignment and Admin Agent assignment.
- Verify comment sending, display, scrolling, and permissions.
- Verify every allowed status transition and reject illegal transitions.
- Verify End Users cannot see other users' tickets or access Team.
- Verify loading, empty, error, and success states.
- Perform manual visual checks for spacing, glass effects, focus states, and responsive behavior.

Frontend Catch-Up Completion Criteria

Days 7–10 should only be marked complete when the frontend and backend work together as one functioning ticket lifecycle.

Create Ticket → Ticket List → Ticket Details → Assignment → Conversation → Status Changes → Resolution / Closure

After this checkpoint, we move into full integration and regression testing before continuing to Day 11.

Current Position

Area	Status	Work
Backend Days 7–10	LARGELY COMPLETE	Ticket CRUD, assignment, comments, authorization, and status workflow have been implemented and tested.
Frontend Days 7–10	CATCHING UP	UI, state, conversation, queue, status controls, and notifications are being aligned.
Integration Testing	NEXT	Full browser-based User, Agent, and Admin testing follows frontend completion.
Day 11+	NOT STARTED	Admin oversight, hardening, security review, deployment, and documentation come after catch-up and regression.

Important Implementation Notes

- Frontend role checks improve user experience but do not replace backend authorization.
- Do not expose status transitions that the backend does not support.
- Use real Agent data rather than hardcoded assignment data.
- Current backend rule: ticket PUT is restricted to Admin and Agent; DELETE is Admin-only.
- Comment permissions: End User = ticket creator, Agent = assigned Agent, Admin = organization-wide access.

This report records the current frontend catch-up work for HelperDesk V1 and is intended as the implementation and verification checklist for Days 7–10.
